pH (and pCO₂) Sensor Refresh Status

December 8, 2021

Christopher Wingard, Trina Lichtendorf, Michael Vardaro, Andrew Reed, Sheri White, Derek Buffet,
Jonathan Fram

Dana Manalang, Wendi Ruef, Orest Kawka, Jennifer Batryn, Allen Smith, Marni Jo Zirbel

Background

- MIO Instrument Team compiled a list of common instruments, ranking based on data quality, reliability, ease of use, safety, vendor quality, obsolescence, and available alternatives (2017-2019)
- pH sensor (Sunburst Sensors SAMI-pH, PHSEN) was identified as an unreliable sensor. Primary issues were data quality and reliability/vendor quality (flooding, ground faults, battery performance, survivability)
- Rankings were based on experience of the MIO Instrument and Data Team members. Though based on expert opinions, the rankings were anecdotal to a degree
- Beginning in 2019, undertook an effort to develop quantifiable metrics of instrument performance
- Goal was to use the instrument data itself to grade performance (unbiased)
- Secondary goal was to develop a framework and workflow for future reviews

Instrument Class	Model	Vendor	Prioritization					Obsolescence	Alternative from same vendor	COTS Alternatives	Alternative within OOI?	Sum
			Data Quality	Reliability	Ease of Use	Safety	Vendor Quality					
			1 = good, 2 = adequate, 3 = bad					1 = not anytime soon, 2 = next few years, 3 = now			1 = none, 2 = one, 3 = more than one

Initial Assessment

- Using data collected from deployments ending Fall 2019 (all arrays and data delivery methods, N = 254)
- $\% \text{ Success} = \text{Days of Good Data} / \text{Opportunity Days} = 44\%$
 - Days of Good Data = $\% \text{ good data} * \text{days of longest record}$
 - $\% \text{ good data} = \text{vendor supplied automated tests of data quality (raw signal levels and computed pH)}$
 - Opportunity Days = days instrument could have operated given the opportunity (excludes days the data logger failed rather than the instrument). Usually, number of days in a deployment
- $\% \text{ Data Collected} = \text{Days of Collected Data} / \text{Opportunity Days} = 71\%$
- See included PHSEN Quality Assessment slides for more detailed information

% Success vs. Year

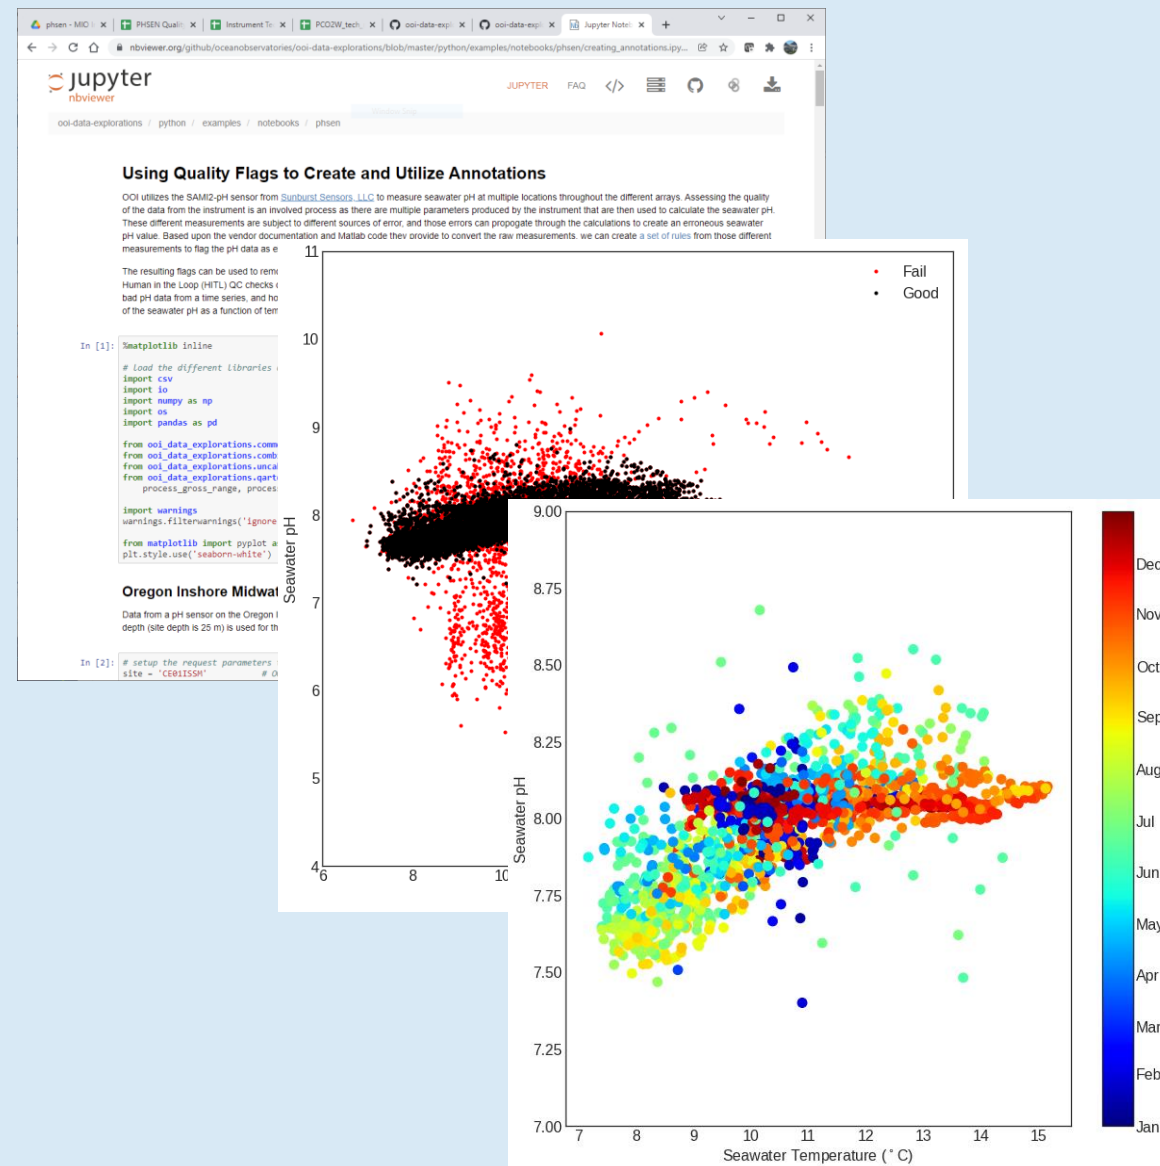

% Success vs. Array

Lessons Learned

- Missing datasets identified and ingested.
- Process forced a deeper review of the vendor's Matlab code (especially their recently updated code versus older version from 2014 used by OOI).
- From that review, developed a more stream-lined set of Matlab functions to parse and process SAMI-pH data, and from there python code to automate creation of QARTOD-style quality flags of the pH data.
- Quality flags can be used to identify blocks of bad data and to create initial annotations for HITL reviews of the data.
- Those automated tests, in addition to existing annotations, have been incorporated into workflows used to generate the QARTOD Gross Range and Climatology test limits.
- Adapted structure of pH quality flags for the SAMI-pCO2 data.

Progress and Path Forward

- COMPLETED TASKS

- Prioritized instrumentation for tech refresh
- Updated Common Instrument Specification (1336-00000)
- Drafted Instrument Tech Refresh Process Document (1100-00007; approved September 2020)
- Quality assessment of PHSEN data (N = 254)
- Identified potential pH instrument vendors
- Evaluate PHSEN requirements

- Drafted RFI document
- Issue RFI
- Assess RFI responses

- NEXT STEPS

- ***Analysis of Alternatives***
- Generate recommendation plan (Q3)
- *Issue RFQ*
- *Generate ECR for implementation of procurement*
- *Procure & Test*

Analysis of Alternatives

- Benchtop testing of the sensors by RCA and EA staff
- Integration and burn-in testing by EA staff
- Side-by-side comparisons of the sensors:
 - The shipboard CTD rosette, with collection of water samples at multiple depths
 - Long term deployment (Fall 2021 to Spring 2022) on the midwater platform (7 m, NSIF) of the Oregon Shelf Surface Mooring (CE02SHSM); periodic water sampling
- *Results presented are necessarily brief. We are engaged in an active test. A formal review with a Recommendation Plan will need to be completed upon conclusion of the test (Q3)*

Vendor	Instrument	
Sunburst Sensors http://www.sunburstsensors.com/index.html	SAMI-pH Ocean pH Sensor	
Idronaut https://www.idronaut.it/	Ocean Seven 310 Multiparameter CTD (OS310)	
Sea-Bird Scientific https://www.seabird.com/	Deep SeapHOx V2 Ocean CT(D)- pH-DO Sensor	

Shipboard CTD Cast

- 2021-09-14, Cast #06 (Washington Offshore)
 - Ship's CTD included an SBE 27 pH/O.R.P (Redox) Sensor calibrated 2020-12-01.
 - OS310 configured to sample at 1 Hz (fastest rate possible). Sampling started immediately after powering on via magnetic switch. Down and upcast.
 - SAMI-pH configured to sample every 5 minutes (every 4 minutes is the fastest rate possible) with sampling delayed (timed to start when CTD was near the bottom of the cast). Upcast only.
 - SeapHOx configured to sample every minute (*fastest rate possible?*) with sampling delayed (timed to start when CTD was near the bottom of the cast). Upcast only.
 - Water samples collected during upcast at 530, 300, 275, 250, 225, 200, 175, 150, 125, 100, 50, 25, 7, and 2 m
 - [Water sampling results posted to Alfresco 2021-11-10](#)
- Issues and results
 - Vendor documentation was confusing and determining the correct settings to use was not straight-forward
 - Only able to complete 1 cast, rather than the 2 that were originally planned
 - Excellent agreement between all sensors and the discrete samples *with a caveat!*

Long Term Deployment

- 2021-09-16 through 2022-04 (Oregon Shelf)
 - OS310 configured to collect 5 samples every 15 minutes
 - SAMI-pH configured to collect 1 sample every hour per OOI sampling plan (reagent limited)
 - SeapHOx configured to collect 1 sample every 15 minutes
 - Discrete samples collected at beginning of deployment with plans to collect more over the course of deployment (during glider and CSPP cruises, as weather allows)
 - [Water sampling results posted to Alfresco 2021-11-10](#)
- Issues and results to date
 - SAMI-pH fouled immediately after deployment. Data shown is from the Oregon Inshore Surface Mooring (CE01ISSM) midwater platform
 - OS310 was offset by +0.2455 from the SeapHOx (based on difference between the sensors averaged over the first 48 hours of the deployment). OS310 data shown has the offset subtracted. **The same offset was applied to the CTD cast data (caveat)**
 - Noticeable linear drift ($r^2 = 0.9688$) in the OS310 data compared to the other instruments

pCO₂ Sensor Refresh Status

- COMPLETED TASKS

- Prioritized instrumentation for tech refresh
- Updated Common Instrument Specification (1336-00000)
- Drafted Instrument Tech Refresh Process Document (1100-00007; approved September 2020)

- NEXT STEPS

- ***Quality assessment of PCO2W data (N = 182)***
- Identified potential pCO₂ instrument vendors

- Drafted RFI document
- Evaluate PCO2W requirements
- Issue RFI
- Assess RFI responses
- Analysis of Alternatives
- Issue RFQ
- Generate recommendation plan
- Generate ECR for implementation of procurement
- Procure & Test
